

User Management

20/03/2026 7:34 am +10

Why permissions are important

- Data protection is extremely important and needs to be managed carefully.
- Within any organisation there will be many AWM users with varying roles and responsibilities.
- The permissions in AWM around access, and which actions can be performed on assets and other data are extensive.
- The Database Owner has the ability to control who has access to the database, which AWM applications they can use, and specifically what actions they can perform within each application.

Database Management Roles

Database Controller and Database Owner

There aren't too many differences between the roles. The **Database Owner** would be the first point of contact that Thinkproject goes to for approval when adding new users to your database or altering the permissions for existing users. That person will also act as one of our main contacts for all things client related where AWM is concerned.

The **Database Controller** is a similar backup role in case the Owner is not available, and has the same permissions as the above. For this, it's usually best to have two different users for the role.

Area of access to AWM

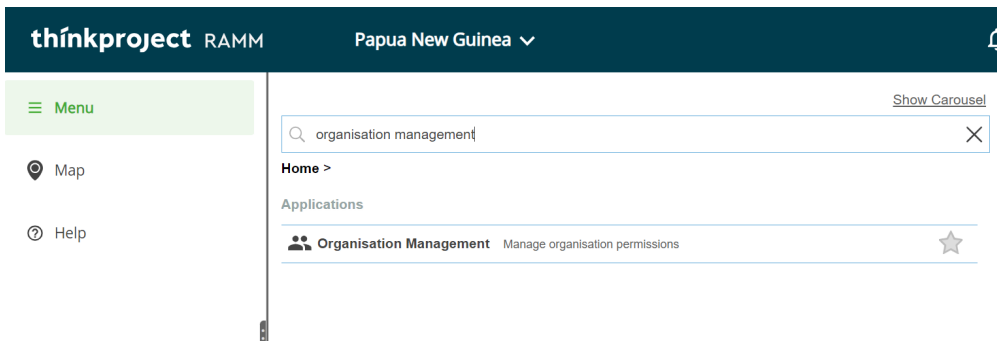

Initially, a user requires access to the database. Once access is granted, there are then further permissions for:

- **Asset Management** - Permissions allowing access to Security Zones (Areas), and to different assets in that Security Zone, as well as permissions for specific AWM applications.
- **Work Management** - Permissions to create a Project/Contract and perform work on the assets in the database. Projects/Contracts are linked to a Security Zone. You can learn more about Work Management in our Jobs/Dispatches course.

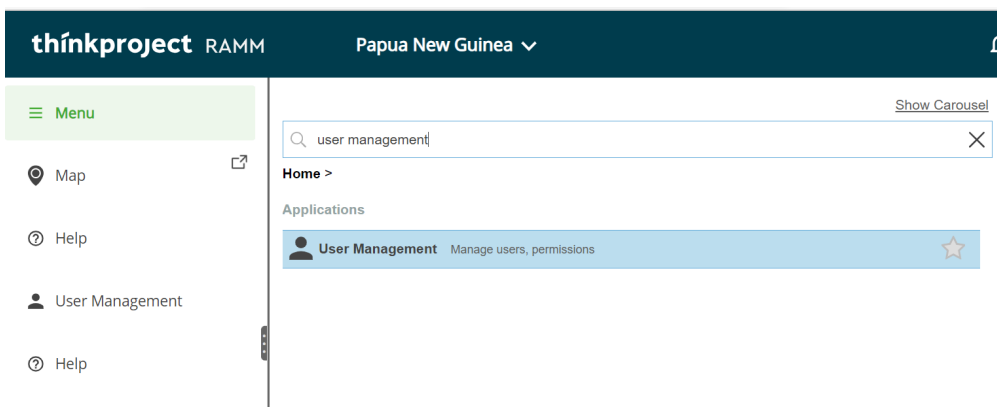

Asset management

- *Security Zone Access - Asset Management*
- Within each database there will be one or more Security Zones. Users are granted access to the zone or zones where the assets are that they are responsible for maintaining.
- Within each Security Zone individual users can be granted permissions in these areas:
 - **General** - Range of general database permissions for the Security Zone
 - **Assets** - Permissions for individual assets
 - **Staff** - Permissions for editing staff access
 - **Specialist** - Permission to access more specialised AWM applications.

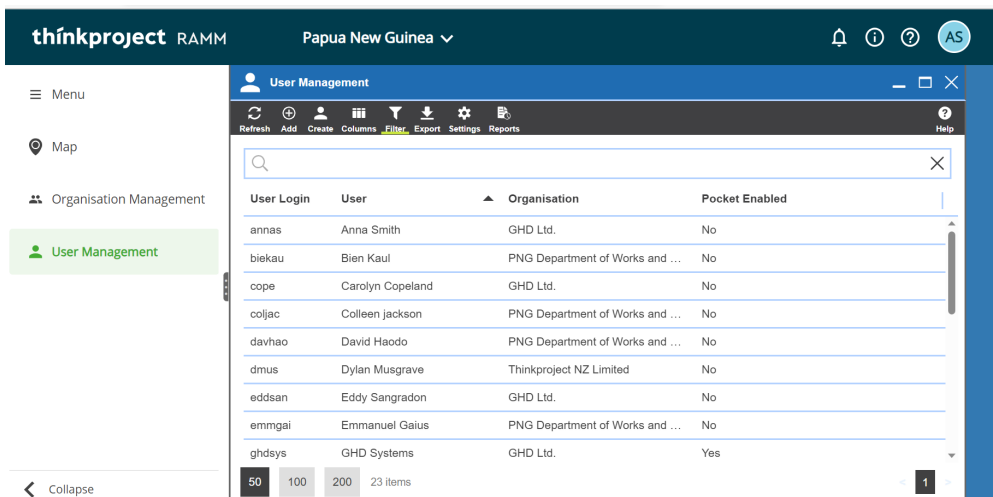

Organisation management- where you create a new user log-in or update your password

User management- lets you view user permissions

Current users with access

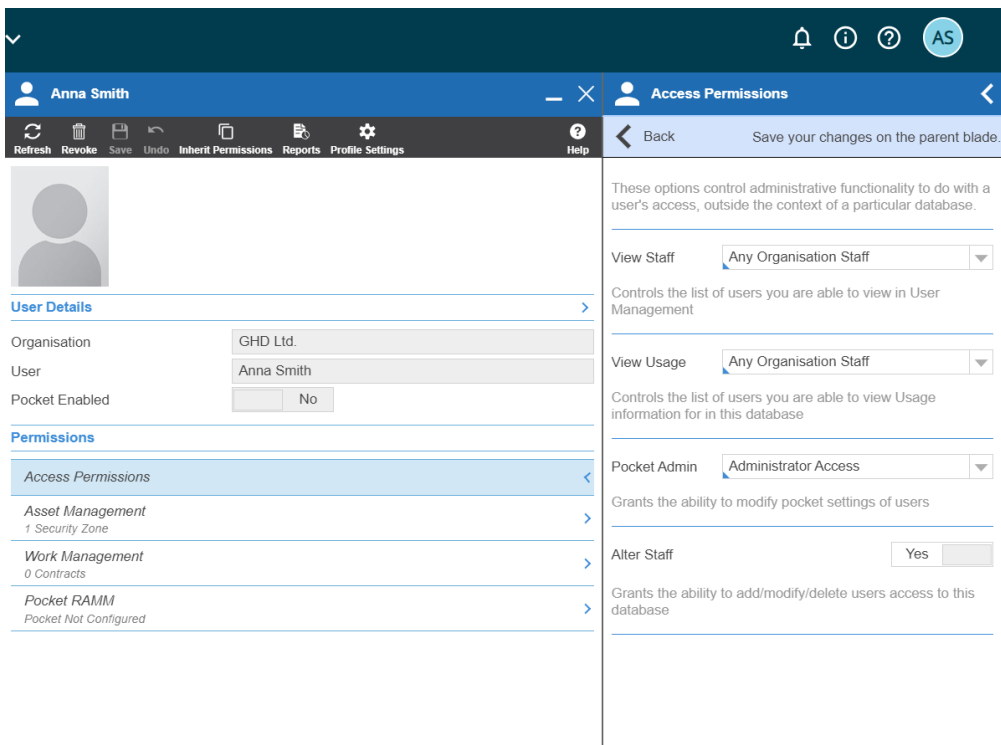

Permission areas in AWM

Access permissions- tells you if the user has permission to view other users and/or if the user can edit other user permissions

Asset Management - shows you the security zone/s a user has access to as well as the users level of permissions in terms of updating/editing asset and inventory data

Work Management - shows all of the contracts a user has access to

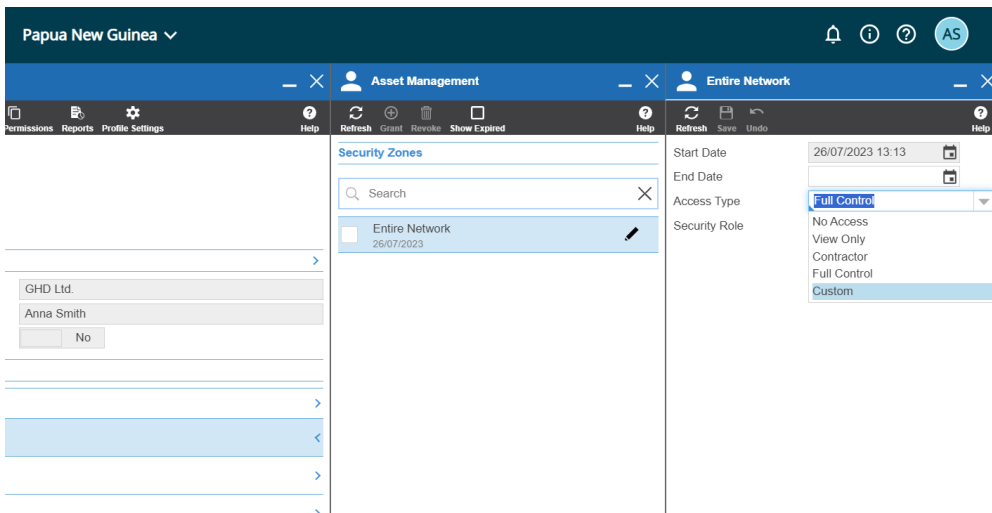

Asset management permission levels

View only access - where you cannot edit asset data but can view all data

Full control - where you can edit all asset data

Contractor - default AWM permissions set up for a contractor

Custom - where you can edit/view pre-selected asset data

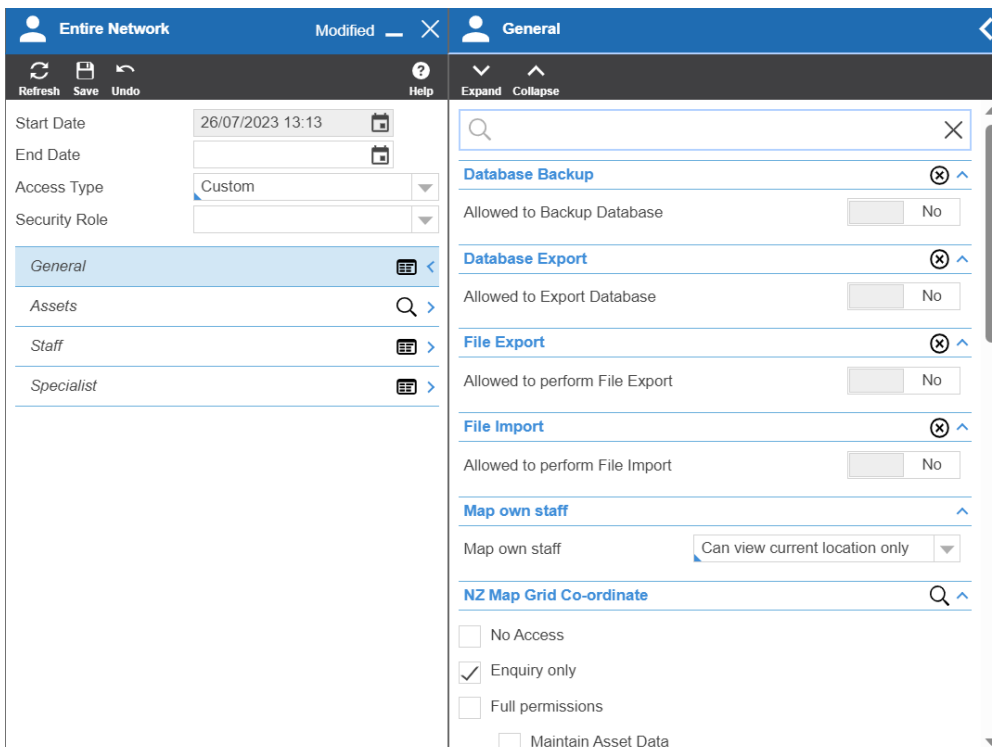

Custom AWM settings

General- covers permissions for things such as exporting data from the database/importing files, adding UDTs, SQL access

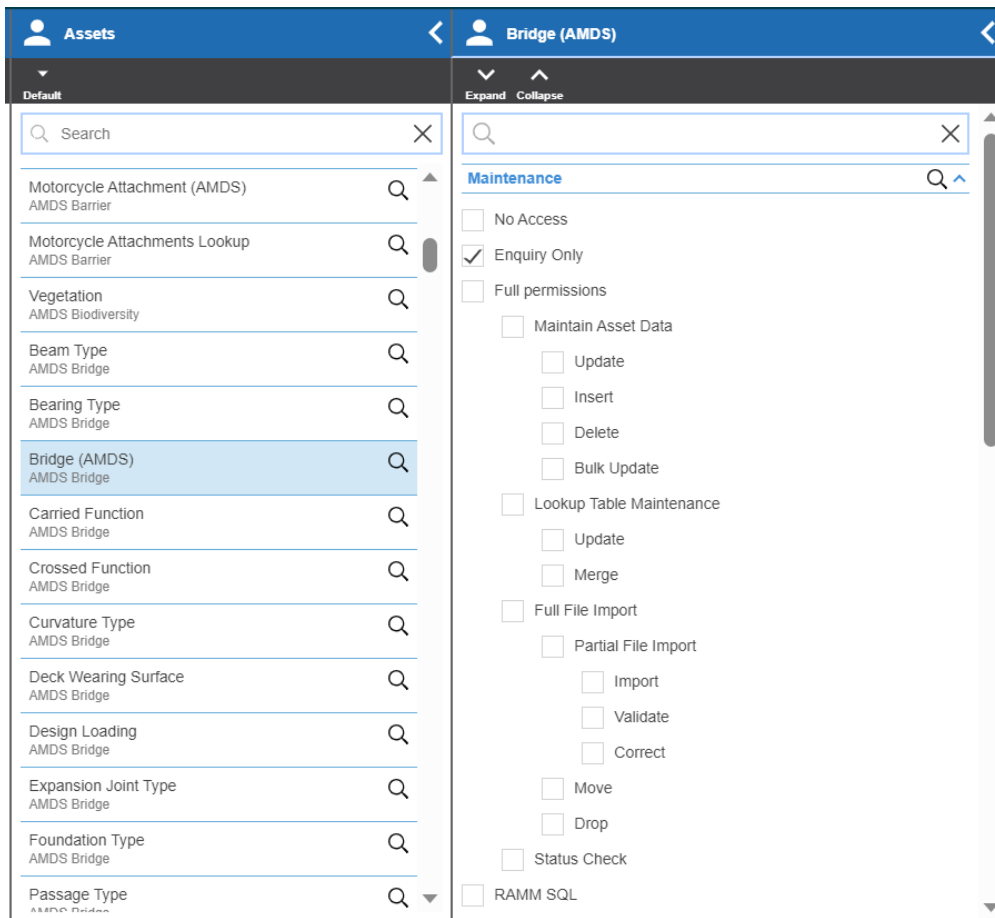

Assets- covers permissions for individual asset types

Staff- covers permissions for other AWM users

Specialist- covers permissions for AWM functions that are specialised such as high speed data, forward works programming, centreline segments

Bridge asset permissions example

Update

Insert

Delete

Bulk Update

Approve (if turned on for the asset type)

AWM permissions key facts

- AWM permissions can be customised to only include certain assets per user
- Anyone can have view only access for all asset data
- Generally 1-2 users will be able to update/edit user permissions as well as add new users
- Currently the entire PNG road network is a single security zone
